

Problem #1

4/8/18

Name: Carlos Flores, PID: 5160328

a.1) Given : $A = \{90, 8, 7, 56, 123, 235, 9, 1, 653\}$

Sort the array A using QuickSort.

1. First pick the pivot & Partition.

- (1) $653 > 90$, $j--$ (2) $1 < 90$, $i++$
(3) $1 < 90$, $7 < 90$, $i++$ (4) $1 < 90$, $56 < 90$, $i++$

(5) $1 < 90$, $123 < 90$, Swap $A[i]$ & $A[j]$

- (1) $123 > 90$, $j--$ (2) $9 < 90$, $i++$
(3) $9 < 90$, $235 < 90$, Swap $A[i]$ & $A[j]$

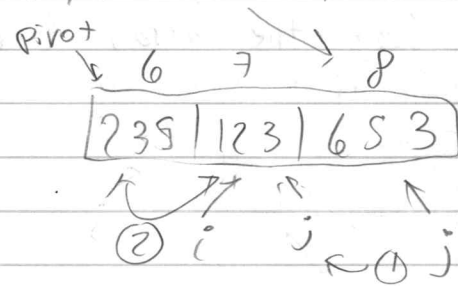

- (1) $235 > 90$, $j--$

(2) $i < j$, Swap pivot & $A[i]$

II. Quicksort(A, left, pivot-1), Quicksort(A, pivot+1, right)

- ① $1 < 9$, $8 < 9$, $i++$
- ② $1 < 9$, $7 < 9$, $i++$
- ③ $1 < 9$, $5 < 9$, Swap $A[i] & A[j]$

- ① $6 < 3$, $2 < 3$, $j--$
- ② $i < j$, Swap $A[i] & A[j]$

- ① $5 < 9$, $j--$
- ② $i < j$, Swap $A[i] & A[j]$, Pivot

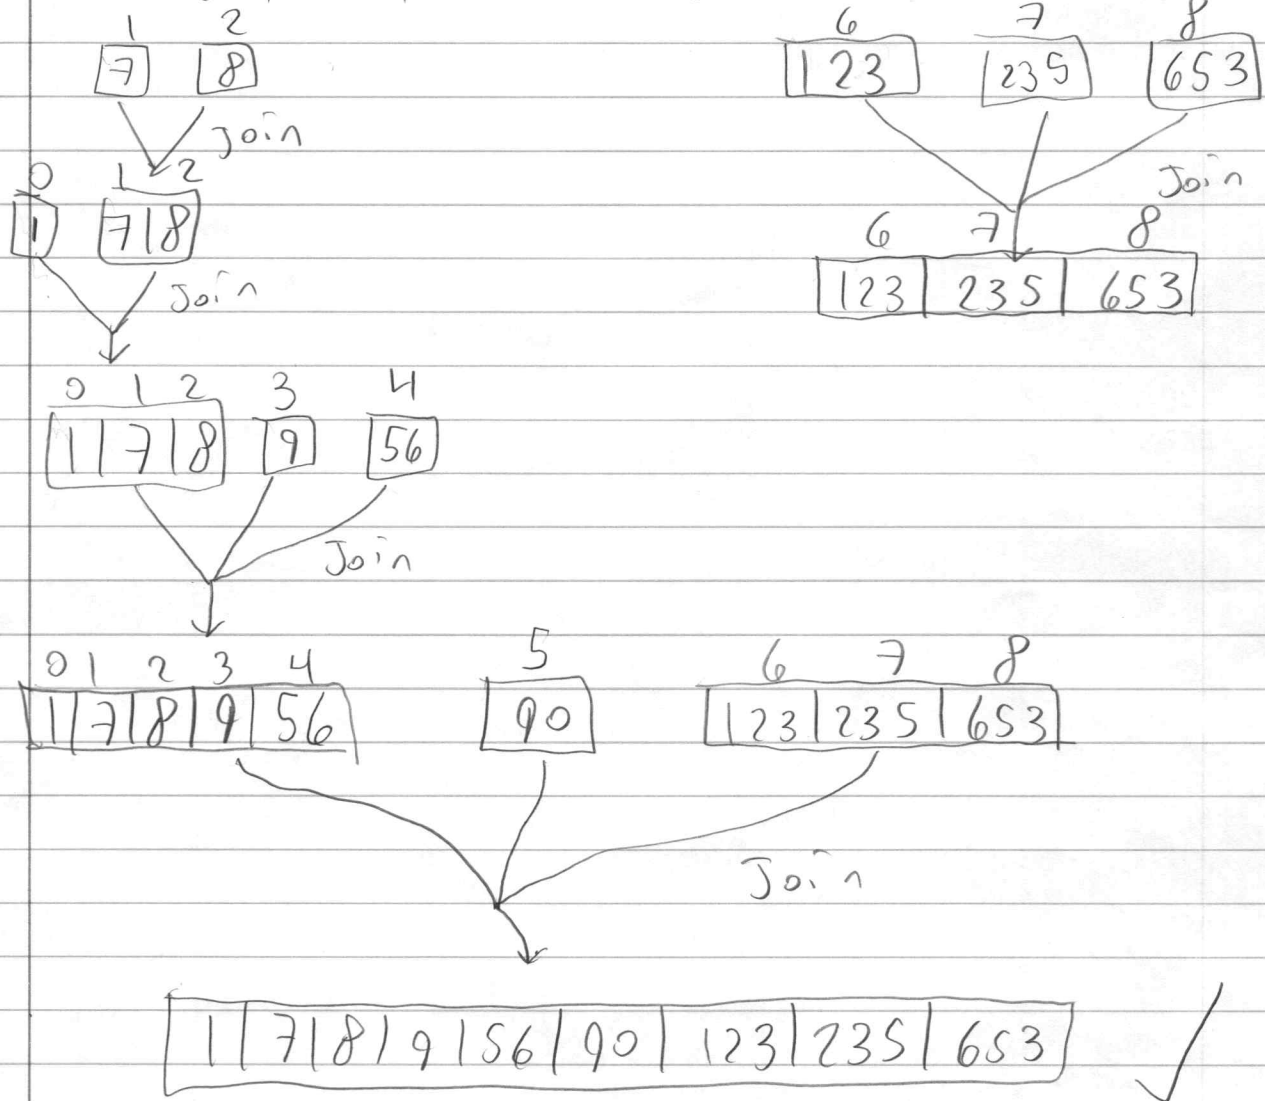

- ① $7 < 1$, $j--$
 - ② Don't Swap, Pivot is min
- Qs(l)
- null Trivial

III. We have reached the trial cases and have divided as much as we can. Time to conquer...

To conquer, simply join the divided segments.

a.2) Sort the array A using MergeSort

I. Divide the Array into Segments

$$\lceil 8/2 \rceil = 4$$

A =

0	1	2	3	4	5	6	7	8
90	8	7	56	123	235	9	1	653

0 to 4
(left)

5 to 8
(right)

Divide

0	1	2	3	4
90	8	7	56	123

5	6	7	8
235	9	1	653

Divide

0	1	2	3	4
90	8	7	56	123

5	6	7	8
235	9	1	653

Divide

0	1	2	3	4
90	8	7	56	123

Divide

5	6	7	8
235	9	1	653

Divide

0	1	2	3	4
90	8	7	56	123

merge 1

0	1	2	3	4
8	90			

merge 3

merge 4

merge 5

merge 2

0	1	2	3	4
7	8	90		

0	1	2	3	4
7	8	90	56	123

5	6	7	8
9	235		

5	6	7	8
1	653		

merge 6

0	1	2	3	4
7	8	56	90	123

0	1	2	3	4
7	8	56	90	123

merge 7

5	6	7	8
1	9	235	653

5	6	7	8
1	9	235	653

merge 8

0	1	2	3	4	5	6	7	8
1	7	8	9	56	90	123	235	653

b) $T(n) = 3T(n/3) + 2cn; T(1) = 0$

This time complexity function follows the signature of the master's theorem: $T(n) = aT(n/b) + O(n^d)$, so we can calculate the time complexity of the function using the master's theorem.

$T(n) = 3T(n/3) + O(n)$

$2cn = O(n)$

$a = 3, b = 3, d = 1$

$a \stackrel{?}{=} b^d$
 $3 \stackrel{?}{=} 3^1$

$3 = 3 \rightarrow 3 = 3$, therefore $T(n) = O(n \log n)$

or $T(n) = O(n \log n)$

c) Regardless of how many comparisons Binary Search performs to find position "P", the worst case amount of swaps is still $O(n^2)$ if [worst-case is a reverse-sorted array, so the number of swaps increases on every iteration as follows:
1 swap + 2 swap + 3 swap + ... miswaps = $O(n^2)$], so the worst-case complexity is still $O(n^2)$

d) The running time complexity of Quicksort in general can be described by:

$T(n) = T(i) + T(n-i-1) + cn$

where "i" is the size of S_1 Partition, and " $n-i-1$ " is the S_2 Partition (-1 excludes the Pivot)

↳ " cN " represents the linear time spent creating the partitions.

Because all of our elements are equal, we can consider that the pivot is virtually the smallest element, and therefore $i = |S_i| = 0$ since no other element is "smaller" than the pivot.

This reduces our complexity to:

$$T(n) = T(0) + T(n-1) + cN, \quad n > 1,$$

but we can consider $T(0) = 1$ because it is a base-case and it simply returns, and can therefore be ignored, and the equation further simplifies:

$$T(n) = T(n-1) + cN, \quad n > 1.$$

↳ Because this is a recursive function, we can telescope.

$$T(n-1) = T(n-2) + c(n-1)$$

$$T(n-2) = T(n-3) + c(n-2)$$

$$T(n-3) = T(n-4) + c(n-3)$$

⋮

⋮

$$T(2) = T(1) + c(2)$$

↳ Plugging them back into $T(n)$ results in:

$$T(n) = T(1) + c(2) + c(3) + c(4) + \dots + c(n-1) + c(n) = O(n^2)$$

Therefore our worst-case is still

$$O(n^2)$$
